

◆ In this session, you will learn to:

---

- ◆ Parse strings using the `split()` method
- ◆ Parse strings using the `StringTokenizer` class
- ◆ Tokenize using the `Scanner` class
- ◆ Work with regular expressions
- ◆ Replace strings using the `replaceAll()` method

◆ `split()` method:

---

- ◆ Used to parse a string
- ◆ Breaks down the string apart when applied with character/s
- ◆ The following embedded Word document shows the utilization of the `split()` method.

split method

◆ StringTokenizer class:

---

- ◆ Used to parse a string
- ◆ Allows accessing tokens by iteration
- ◆ The embedded Word document demonstrates the utilization of the StringTokenizer class.

StringTokenizer  
class

## ◆ Scanner class:

---

- ◆ Used to tokenize an input stream or a string
- ◆ Used to tokenize numbers and convert them into primitive type
- ◆ The embedded Word document shows how to tokenize a string or a stream using the `Scanner` class.

Scanner class

## ◆ Regular expressions:

---

- ◆ Used to match strings of text
- ◆ Provide detailed vocabulary
- ◆ Used to search and extract or replace strings

## ◆ Java objects used in regular expression:

- ◆ `Pattern`
- ◆ `Matcher`
- ◆ `PatternSyntaxException`
- ◆ `java.util.regex`

- ◆ The `Pattern` object defines a regular expression.
  - ◆ The `Matcher` object specifies the target string to search.
  - ◆ The `Pattern` and `Matcher` objects work together.
  - ◆ The following embedded Word document shows the search operation using the `Pattern` and `Matcher` classes.
- 

**Pattern and  
Matcher classes**

- ◆ The following table shows the character class patterns to be used in regular expressions.
- 

<i>Character</i>	<i>Description</i>
<i>.</i>	<i>Matches any single character (letter, digit, or special character), except end-of-line markers</i>
<i>[abc]</i>	<i>Would match any “a”, “b”, or “c” in that position</i>
<i>[^abc]</i>	<i>Would match any character that is not “a”, “b”, or “c” in that position</i>
<i>[a-c]</i>	<i>A range of characters (in this case, “a”, “b”, and “c”)</i>
<i> </i>	<i>Alteration; essentially an “or” indicator</i>

- ◆ Target string: *It was the best of times*
- ◆ The following table shows the character class patterns applied on the preceding target string.

<i>Pattern</i>	<i>Description</i>	<i>Text Matched</i>
<i>w.s</i>	<i>Any sequence that starts with a “w” followed by any character followed by “s”.</i>	<i>It <b>was</b> the best of times</i>
<i>w[abc]s</i>	<i>Any sequence that starts with a “w” followed by “a”, “b”, or “c” and then “s”.</i>	<i>It <b>was</b> the best of times</i>
<i>t[^eao]mes</i>	<i>Any sequence that starts with a “t” followed by any character that is not “a”, “e” or “o” followed by “mes”.</i>	<i>It was the best of <b>times</b></i>

- ◆ Character classes are used repeatedly.
  - ◆ These classes are turned into predefined character classes.
  - ◆ The following table shows the predefined characters and the character classes.
- 

<i>Predefined Character</i>	<i>Character Class</i>	<i>Negated Character</i>	<i>Negated Class</i>
<code>\d (digit)</code>	<code>[0-9]</code>	<code>\D</code>	<code>[^0-9]</code>
<code>\w (word char)</code>	<code>[a-zA-Z0-9_]</code>	<code>\W</code>	<code>[^a-zA-Z0-9_]</code>
<code>\s (white space)</code>	<code>[\r\t\n\f0XB]</code>	<code>\S</code>	<code>[^\r\t\n\f0XB]</code>

- ◆ Target string: *Jo told me 20 ways to San Jose in 15 minutes.*
- ◆ The following table shows the predefined character class patterns on the preceding target string.

<i>Pattern</i>	<i>Description</i>	<i>Text Matched</i>
<code>\\d\\d</code>	<i>Find any two digits. **</i>	<i>Jo told me <b>20</b> ways to San Jose in 15 minutes.</i>
<code>\\sin\\s</code>	<i>Find “in” surrounded by two spaces and then the next three characters.</i>	<i>Jo told me 20 ways to San Jose <b>in</b> 15 minutes.</i>
<code>\\Sin\\s</code>	<i>Find “in” surrounded by two non space characters and then the next three characters.</i>	<i>Jo told me 20 ways to San Jose in 15 <b>minutes</b>.</i>

- ◆ Target string: *Longlonglong ago, in a galaxy far far away*
- ◆ The following table shows implementation of quantifier patterns on the preceding target string.

<i>Pattern</i>	<i>Description</i>	<i>Text Matched</i>
<i>ago.*</i>	<i>Find “ago” and then 0 or all the characters remaining on the line.</i>	<i>Longlonglong <b>ago, in a galaxy far far away</b></i>
<i>gal.{3}</i>	<i>Match “gal” plus the next three characters. This replaces “...” as used in a previous example.</i>	<i>Longlonglong ago, in a <b>galaxy</b> far far away</i>
<i>(long){2}</i>	<i>Find “long” repeated twice.</i>	<i>Long<b>longlong</b> ago, in a galaxy far far away</i>

◆ Greediness principle:

---

◆ Regular expression grabs as many characters as possible

◆ ? operator:

◆ Limits the search to the shortest possible match

◆ Target string: *Longlonglong ago, in a galaxy far far away.*

◆ The following table shows greediness and the usage of ? operator on the preceding target string.

<i>Pattern</i>	<i>Description</i>	<i>Text Matched</i>
<i>ago.*far</i>	<i>A regular expression always grabs the most characters possible.</i>	<i>Longlonglong ago, in a galaxy far far away.</i>
<i>ago.*?far</i>	<i>The “?” character essentially turns off greediness.</i>	<i>Longlonglong ago, in a galaxy far far away.</i>

- ◆ Boundary characters match different parts of a line using the regular expressions.
- ◆ The following table shows the boundary characters to be matched in a string.

<i>Anchor</i>	<i>Description</i>
<code>^</code>	<i>Matches the beginning of a line</i>
<code>\$</code>	<i>Matches the end of a line</i>
<code>\b</code>	<i>Matches the start or the end of a word</i>
<code>\B</code>	<i>Does not match the start or the end of a word</i>

- ◆ Target string: *it was the best of times or it was the worst of times*
- ◆ The following table shows the usage of boundary characters on the preceding target string.

Pattern	Description	Text Matched
<code>^it.*?times</code>	The sequence starts a line with “it” followed by some characters and ends a line with “times”, and the greediness is off	<b>it was the best of times</b> or it was the worst of times
<code>\\sit.*times\$</code>	The sequence that starts with “it” followed by some characters and ends the line with “times”	it was the best of times or <b>it was the worst of times</b>
<code>\\bor\\b.{3}</code>	Find “or” surrounded by word boundaries, plus the next three characters	it was the best of times <b>or</b> it was the worst of times

- ◆ Parentheses are used with regular expressions to identify parts of a string to match.
- ◆ Target string: *george.washington@example.com*
- ◆ The following table shows the use of matching and grouping on the preceding target string.

<i>String</i>	<i>Pattern</i>
<i>Match 3 Parts</i>	<i>(george).(washington)@(example.com)</i>
<i>Group Numbers</i>	<i>(1).(2)@(3)</i>
<i>Pattern</i>	<i>(\lS+?)\l.(\lS+?)@(\lS+)</i>

- ◆ Search and replace can be performed by the `replaceAll()` method.
- ◆ The following embedded Word document shows the usage of the `replaceAll()` method.

`replaceAll`  
method
